

VIG Product Design System

Valmiki International Gurukulam · Brand & UI Guidelines · Version 1.0

SOURCE OF TRUTH

This system formalizes the visual language already established in the supplied VIG product flows. The institutional logo remains unchanged; the product UI is not required to inherit the logo palette.

Design character: calm · warm · premium · educational · human · structured · approachable

Representative supplied product flow — used as visual reference, not redesigned.

1. Brand Architecture

VIG stands for Valmiki International Gurukulam. The brand system has three deliberately separate layers:

- Institutional identity — the official VIG logo and its original artwork/colors. Do not recolor, redraw, distort, simplify, or force its colors into the application.
- Digital product identity — the interface language visible in the supplied screens: deep navy, violet, pale lavender, warm white, restrained borders, serif display typography and sans-serif functional typography.
- Semantic identity — green, blue, orange, coral/red and pink communicate status, subjects, learning/development states and system feedback. These colors are functional, not competing primary brand colors.

Logo rules

Use the supplied logo artwork unchanged. Preserve its proportions and internal color relationships. Keep clear space around it equal to at least the visual height of the central peacock-eye motif where practical. On dense product navigation, prefer a compact approved lockup rather than shrinking the full mark until details become illegible.

Never: recolor the mark purple to match the UI; place it over visually noisy imagery without a clear field; stretch it; add shadows/glows; rotate it; rebuild it with substitute shapes; or use individual logo colors as justification for arbitrary UI colors.

2. Product Color System

The UI is predominantly neutral. Violet creates interaction hierarchy; navy creates typographic authority. Tints are used more often than saturated fills.

Token	Sample	Hex	Primary use	Do / Don't
color.brand.navy		#11165C	Primary headings, high-emphasis text, key navigation	Use for authority; avoid filling large surfaces.
color.brand.violet		#5B2CCB	Primary CTA, active nav, selected states, progress	Primary interactive accent. One dominant CTA per decision area.
color.brand.violetHover		#4B22B5	Hover/pressed emphasis	Do not introduce unrelated darker purples.
color.surface.lavender		#F3EEFF	Selected cards, AI surfaces, soft panels	Use as a tint, not as the entire canvas.
color.surface.lavender2		#FAF8FF	Subtle grouped backgrounds	Useful for hierarchy without extra borders.
color.surface.canvas		#FCFBFF	App/page background	Keep the interface bright and calm.
color.surface.card		#FFFFFF	Cards, modals, forms	Default content surface.
color.border.default		#E7E3F0	Card/input/divider borders	Borders should recede behind content.
color.text.primary		#11165C	Headings and important labels	Never replace all body text with pure black.
color.text.secondary		#5F6080	Descriptions, metadata	Maintain readable contrast.

color.text.muted		#8D8DA5	Tertiary metadata, placeholders	Do not use for essential instructions.
------------------	---	---------	---------------------------------	--

Semantic colors

Token	Sample	Hex	Primary use	Do / Don't
success		#3FA45B	Available, mastered, present, consistent, saved	Pair with text/icon; don't rely on color alone.
success.bg		#EDF8EF	Success/status background	Keep saturation low.
info		#3F83E8	Learning, science, informational state	Use consistently for informational meaning.
info.bg		#EDF5FF	Informational surface	Avoid using as decorative brand blue.
warning		#F29A38	Developing, warning, attention	Not for destructive actions.
warning.bg		#FFF5E8	Warning/developing background	Use with concise explanation.
danger		#F05B5B	Errors, absent, destructive, emerging/needs attention where defined	Reserve stronger red for genuine risk/error.
danger.bg		#FFF0F0	Error/attention surface	Avoid large saturated red blocks.
pink		#E95D86	Emotional/development accent	Secondary semantic accent only.
pink.bg		#FFF1F6	Emotional/development tint	Never compete with primary violet CTA.

3. Typography

The visual identity depends on a serif/sans pairing. The serif provides warmth and editorial character; the sans-serif keeps dense operational UI highly legible.

Role	Recommended family	Desktop	Mobile	Usage
Display / H1	Georgia (fallback: serif)	32–40 / 1.15	28–32 / 1.15	Greetings, major page titles
H2	Georgia	24–28 / 1.2	22–26 / 1.2	Section/page titles
H3	Georgia	18–22 / 1.25	18–20 / 1.25	Card/flow headings
Body L	Aptos / Inter-like sans	16 / 1.5	16 / 1.5	Prominent body copy
Body	Aptos / Inter-like sans	14 / 1.45	14 / 1.45	Default UI copy

Small	Aptos / Inter-like sans	12 / 1.4	12 / 1.4	Metadata, helper text
Label	Aptos / Inter-like sans	12–14 / 1.2	12–14 / 1.2	Controls, tabs, buttons
Micro	Aptos / Inter-like sans	10–11 / 1.25	10–11 / 1.25	Dates, compact tags

Weight guidance: regular for body copy; medium/semibold for labels and navigation; semibold/bold for important headings. Avoid excessive bolding. Sentence case is the default. All-caps is reserved for tiny category/eyebrow labels.

4. Spacing & Layout

Use a 4 px base unit. Most production spacing should resolve to the following token set.

Token	Sample	Hex	Primary use	Do / Don't
space.1		4	Micro gaps	Icon-to-label details only.
space.2		8	Tight internal spacing	Tags, compact controls.
space.3		12	Small component spacing	List rows and grouped metadata.
space.4		16	Default component padding	Core mobile rhythm.
space.5		20	Comfortable card padding	Useful in medium cards.
space.6		24	Section/card padding	Primary desktop rhythm.
space.8		32	Section separation	Use between meaningful groups.
space.10		40	Large separation	Major page sections.
space.12		48	Page-level breathing room	Use selectively.

Desktop: persistent left navigation where role complexity requires it; content should align to a clear vertical grid and avoid unnecessary full-width stretching. Mobile: preserve the same hierarchy, collapse navigation into the bottom bar/header, and prioritize one-column reading.

Recommended content gutters: 24–32 px desktop within working panels; 16–20 px mobile. Minimum touch target: 44×44 px. Dense administrative rows may look visually smaller, but their interactive hit area should remain accessible.

5. Shape, Radius, Borders & Elevation

- Radius 8 px — compact controls, tags and small fields.
- Radius 12 px — standard inputs, rows and small cards.
- Radius 16 px — primary cards and panels.
- Radius 20–24 px — large mobile surfaces, hero cards and selected expressive containers.
- Pills — only for statuses, filters, segmented controls and compact categorical labels.
- Borders — generally 1 px using the default lilac-gray border. Selected elements may use violet or semantic borders.
- Shadows — restrained and soft. Prefer border + surface contrast first; shadow is secondary. Avoid heavy floating-card shadows.

6. Components

Buttons

- Primary: violet fill, white label, medium/semibold text. Use for the action that advances or commits the current flow.
- Secondary: white/light surface with subtle border and navy/violet label.
- Tertiary: text/icon action with no strong container.
- Destructive: coral/red treatment only when the action is genuinely destructive.
- Disabled: muted fill/text with clear loss of emphasis; never communicate disabled state only by lowering opacity until text becomes unreadable.

Cards & rows

Default cards are white with subtle borders and generous padding. Selected cards receive a pale lavender fill and/or violet border. Semantic cards use very pale tinted backgrounds. Avoid saturated full-card fills.

Inputs

Inputs use white surfaces, 1 px neutral borders, clear labels above the field, and visible focus treatment in violet. Errors switch the border/helper treatment to danger red. Helper text stays concise and directly below the relevant control.

Navigation

Active navigation is identified with violet icon/text and a pale lavender container or indicator. Desktop uses a left rail/sidebar in administrative contexts. Mobile uses a bottom navigation bar for primary destinations and a compact top bar for contextual actions.

Status chips

Use short, stable language such as Mastered, Learning, Needs Support, To Learn, Developing, Emerging, Consistent, Present, Absent, Available. Pair semantic color with text so meaning survives grayscale and accessibility modes.

7. Iconography & Illustration

Icons should be simple, rounded line icons with consistent optical weight. Avoid mixing filled, skeuomorphic and highly detailed icon families. Illustrations should retain the supplied product's soft educational character: pale lavender atmosphere, clean shapes, limited accents, and generous negative space.

Photography and moments are the exception: student/class imagery can be warm and vivid, but UI chrome around photography remains restrained so the media becomes the focal point.

8. Data, Subjects & Status Mapping

Subject colors help recognition but must remain secondary to the subject name. Preserve a stable mapping across schedule cards, learning maps, tags and moments. Based on the supplied visual language: Mathematics → violet; English → orange; Science → blue; Telugu → green. Additional subjects should receive distinct but similarly restrained accents.

Learning-state hierarchy should remain stable across the product. A user should never encounter the same color meaning 'Mastered' in one view and 'Needs Support' in another.

9. Motion & AI States

AI interactions are presented as supportive workflow states rather than a separate visual universe. Use violet/lavender for recording, processing, interpretation and review. Progress rings, waveforms and subtle sparkle motifs may reinforce AI activity. Motion should be calm and functional: short fades, progress movement and restrained scale transitions.

- Recording: show elapsed time and an unmistakable stop/pause action.
- Processing: show what the system is doing in human language; avoid fake precision where progress is indeterminate.
- AI draft: clearly communicate that generated notes/observations are reviewable before saving.
- Confirmation: use a simple success mark, concise outcome and one obvious next action.

10. Accessibility & Content Rules

- Target WCAG AA contrast for text and controls.
- Never encode status solely through color; include icon, label, shape or supporting text.
- Minimum 44×44 px interactive targets on touch interfaces.
- Keep language direct and reassuring without becoming childish.
- Prefer specific action labels: Save Class Record, Review Student, Confirm & Apply — not vague labels such as Okay.
- Use consistent names for the same object across teacher, admin and parent experiences.
- Dates and times must be explicit where scheduling consequences exist; preserve the configured timezone.

11. Responsive Behavior

Desktop and mobile are one system, not two brands. Preserve content priority, semantic colors, typography roles, component styling and interaction language. Reflow rather than miniaturize.

- Side navigation → bottom navigation or compact mobile menu.
- Multi-column dashboards → stacked priority order.
- Large tables/calendars → day/agenda-oriented mobile views where needed.
- Modals → bottom sheets or full-height mobile panels when content is substantial.
- Desktop hover states must have touch equivalents; no critical action may depend on hover.

12. Product Design Do / Don't

DO	DON'T
Use violet to establish a clear interaction hierarchy.	Turn every decorative element purple.
Keep most surfaces white or extremely lightly tinted.	Fill the product with saturated logo colors.
Use serif typography for expressive hierarchy.	Use serif for dense labels, tables or tiny metadata.
Use semantic colors consistently.	Invent a new meaning for a semantic color screen by screen.
Use generous spacing and subtle borders.	Compensate for weak hierarchy with heavy shadows.
Keep the official VIG logo unchanged.	Recolor the logo to match the digital product palette.
Design mobile by reflowing content priorities.	Shrink desktop layouts until they fit a phone.

13. Visual Reference — Supplied Product Screens

The following boards are the design reference for future VIG screens. They demonstrate the intended density, hierarchy, card treatment, responsive relationship and semantic use of color.

14. Implementation Tokens

Recommended starter tokens for Figma variables / CSS / app theme configuration:

COLOR

brand/navy	#11165C
brand/violet	#5B2CCB
brand/violetHover	#4B22B5
surface/canvas	#FCFBFF
surface/card	#FFFFFF
surface/lavender	#F3EEFF
border/default	#E7E3F0
text/primary	#11165C
text/secondary	#5F6080
text/muted	#8D8DA5
semantic/success	#3FA45B
semantic/info	#3F83E8
semantic/warning	#F29A38
semantic/danger	#F05B5B
semantic/pink	#E95D86

SPACING

1	4px
2	8px
3	12px
4	16px
5	20px
6	24px
8	32px

10 40px
12 48px

RADIUS
sm 8px
md 12px
lg 16px
xl 20px
2xl 24px
pill 999px

Governance rule: When a new screen conflicts with this guide, compare it against the supplied approved flows first. Reuse existing tokens/components before creating new visual patterns.
