

VIG — How the Entire Product Works

A plain-English, role-by-role explanation of every major feature and how the features connect.

This version is intentionally written as a product walkthrough rather than a feature checklist. Each feature is explained in a full paragraph, followed by a concrete example and the actual user flow. You should be able to give this document to someone who has never seen VIG and have them understand what happens before a class, during a class, after a class, and what each role sees.

The simplest way to understand VIG

VIG follows one continuous cycle. The administrator first builds the school's structure: what subjects exist, what levels and skills exist inside those subjects, who the students and teachers are, and when everyone is available. The administrator then creates the timetable. When a scheduled class happens, the teacher opens that class in VIG, marks attendance and records a natural voice note about what happened. VIG uses AI to turn that recording into a draft class record, but the teacher reviews and approves it before anything is saved. Approved information updates the child's learning progress, development evidence and moments. The parent then sees a simplified version of that information through the Parent Portal and the weekly update. In other words, information should be entered once and then flow through the system instead of being re-entered by multiple people.

ADMIN SETS UP THE SCHOOL → ADMIN SCHEDULES CLASS → TEACHER TEACHES → TEACHER RECORDS WHAT HAPPENED → VIG STRUCTURES THE INFORMATION → TEACHER APPROVES IT → STUDENT RECORD UPDATES → PARENT SEES THE APPROVED STORY.

PART I — ADMIN PORTAL: HOW IT WORKS

Think of the Admin Portal as the control room of the Gurukulam. The administrator is not expected to document every class. Their responsibility is to create the structure that makes the rest of VIG work, make sure the timetable is possible, manage students and teachers, and intervene when something is wrong.

A. Getting into VIG

Admin Login

Every administrator has a VIG account. The login screen is simply the secure entrance to the school-management side of the platform. Once the administrator signs in, VIG knows that this person has administrative permissions and can therefore see school-wide information rather than the limited information available to a teacher or parent.

Example in practice. An administrator enters their username and password on Monday morning and lands on the School Overview rather than having to choose a portal manually.

What the user does. Enter username and password → tap Log In → if the credentials are correct, open Admin Home. If they are incorrect, keep the administrator on the login screen and explain what needs to be corrected.

First Login and Password Setup

When the school creates an account for an administrator, teacher or parent, the initial credential can be temporary. On the first successful login, VIG asks that person to create their own password before exposing the rest of the product. This avoids leaving long-term shared or default passwords in use.

Example in practice. The school gives a new administrator temporary credentials. She signs in once, creates a private password and then continues into VIG.

What the user does. Temporary login → Create New Password → enter password twice → satisfy requirements → Update Password → enter VIG.

B. Admin Home — What the Administrator Sees Every Day

School Overview / Normal Day

The Admin Home screen is not meant to be a generic dashboard full of statistics. Its job is to answer three practical questions immediately: what classes are happening today, is anything preventing those classes from happening, and what does the administrator need to deal with? The main area therefore shows today's classes in time order while a Needs Attention area surfaces operational problems.

Example in practice. It is Tuesday morning. VIG shows Mathematics at 9:00 with Priya, English at 10:30 with Meera and Science after lunch. Above the timetable it warns that one Friday class is affected by a teacher's unavailability.

What the user does. Login → scan Needs Attention → resolve anything urgent → scan today's timetable → open a class, teacher or student only when more detail is needed.

Needs Attention

Needs Attention is VIG's exception-management system. Instead of making the administrator inspect every timetable, student and teacher manually, VIG detects situations that require intervention and brings them to the Home screen. These could include a teacher becoming unavailable for classes already scheduled, an availability conflict, or a student whose setup is incomplete. Several classes caused by the same problem should appear as one grouped issue so the administrator solves the cause once.

Example in practice. Priya marks herself unavailable Friday morning, but she already has three classes. Admin Home says 'Priya is unavailable — 3 classes affected' rather than displaying three unrelated warnings.

What the user does. Open the issue → see why it exists and which records/classes are affected → choose Resolve or Review → VIG opens the correct management screen → make the change → save → the issue disappears when resolved.

What VIG does in the background. VIG continuously compares the schedule with active student/teacher configuration and generates actionable exceptions.

No Issues / No Classes

VIG must also explain healthy empty states. If there are no operational problems, the administrator should see an explicit all-clear rather than wonder whether the system failed to load. Likewise, if there are no classes on a particular day, VIG should say so clearly instead of showing a blank timetable.

Example in practice. Sunday has no classes, so Home says 'No classes scheduled today.' On another day with classes but no problems, Needs Attention says everything looks good.

What the user does. Open Home → VIG evaluates the selected day → show normal classes, a healthy empty state, or an issue state as appropriate.

C. Setting Up a New School

Setup Checklist

A brand-new VIG account cannot meaningfully schedule classes yet because the system does not know what can be taught, who can teach it, who needs to learn it, or when those people are available. VIG therefore guides the administrator through setup in dependency order: Curriculum first, Teachers second, Students third and Schedule last. The checklist is not just onboarding decoration; it prevents the administrator from reaching a scheduling screen that has no usable data.

Example in practice. A new Gurukulam account starts with '1. Set up Curriculum, 2. Add Teachers, 3. Add Students, 4. Create Schedule.' After curriculum is completed, that item receives a check and Add Teachers becomes the obvious next action.

What the user does. First login → complete Curriculum → return/continue to Teachers → add teachers and capabilities → add students and their levels → create schedule.

What VIG does in the background. VIG tracks whether each prerequisite contains enough valid data to support the next step.

D. Curriculum — What the School Teaches

Subjects, Levels, Topics and Skills

The curriculum is a hierarchy. A Subject is the broad area such as Mathematics. Inside Mathematics are Levels, representing the progression a student moves through. A Level contains Topics such as Fractions or Geometry, and each Topic contains Skills that can actually be tracked. The Skill is the smallest progress unit. This hierarchy matters because a child is not simply 'good at Mathematics'; VIG needs to know which level they are working at and which skills inside that level they have mastered or still need support with.

Example in practice. For Mathematics Level 6, the school may create a Fractions topic containing skills such as comparing fractions, adding unlike fractions and solving fraction word problems.

What the user does. Curriculum → open/add Subject → open/add Level → open/add Topic → create/reorder Skills → save.

What VIG does in the background. VIG uses this structure later when assigning student levels and when teacher-approved learning updates change a skill's progress status.

Skill Statuses

Once a curriculum skill exists, a student's relationship with that skill can be tracked using a small set of understandable states: To Learn means it has not yet been worked on, Learning means the child is currently developing it, Needs Support means additional help is required, and Mastered means the child has demonstrated sufficient understanding. These statuses belong to the individual student, not to the curriculum definition itself.

Example in practice. Aarav and Maya can both be in Mathematics Level 6, while Aarav has Mastered comparing fractions and Maya is still Learning it.

What the user does. Student → Learning → subject → level/topic → skill → update status with optional note/evidence → save.

Moving a Student to the Next Level

Level progression should not erase the learning journey. When a student is ready to move from one level to another, VIG first summarizes what has been completed and what remains unfinished. The authorized user can then confirm the move. Skills that still need work can be identified for carry-forward, while the previous level remains in history. This allows the current curriculum to advance without pretending that every old skill disappeared.

Example in practice. Aarav finishes Level 6 with most skills mastered but still needs support with one ratio skill. The school moves him to Level 7 and carries that skill forward for review.

What the user does. Student Learning → Change/Complete Level → review status summary → decide what carries forward → Move to Level 7 or Stay → confirm.

What VIG does in the background. VIG changes the active level but preserves the historical Level 6 record.

E. Students — How a Learner Enters the System

Add Student

Adding a student means much more than entering a name. VIG needs enough information to make that child teachable and schedulable. The administrator enters basic details, chooses the subjects the child studies, assigns the child's current level separately for each subject, defines when the child is available and connects parent access. A final review screen lets the administrator catch mistakes before creation.

Example in practice. Aarav may be Level 6 in Mathematics, Level 5 in English and Level 4 in Science. He may be available Monday–Friday from 9:00 to 3:00, and his mother receives Parent Portal access.

What the user does. Students → Add Student → Basic Details → Subjects & Levels → Weekly Availability → Parent Access → Review → Create Student.

What VIG does in the background. Once created, VIG can use the student's subjects, levels and availability during scheduling.

Student Profile

The Student Profile is the long-term record for one child. The Overview contains identity and current setup; Learning shows curriculum progress; Development shows qualitative growth evidence; Moments shows media and memories; and History preserves previous information. Administrative controls live behind Manage Student so viewing and editing are not mixed together.

Example in practice. An administrator opens Aarav and can immediately see his current subject levels, then switch to Development to review confidence observations or Moments to see recent class media.

What the user does. Students → select student → Overview / Learning / Development / Moments / History → Manage Student only when configuration must change.

Student Availability

Availability tells VIG when a student can actually attend classes. It is separate from the timetable: availability is the boundary of possible times, while the schedule contains the actual booked classes. The administrator can define recurring weekly windows for each day, which VIG later compares against teacher availability and existing classes.

Example in practice. A student is available Monday and Wednesday 9:00–1:00 but unavailable Tuesday. VIG should not recommend Tuesday when looking for a recurring Mathematics slot.

What the user does. Student → Manage Student → Availability → turn days on/off → enter start/end times → save.

What VIG does in the background. Scheduling treats unavailable periods as invalid options.

Parent Access and Student Status

Parent access links the appropriate parent account to the child's parent-facing record. Student status controls whether the child participates in active school workflows. Archiving should remove a student from active operations without deleting their learning and development history.

Example in practice. A student leaves the Gurukulam. Admin archives the student; they stop appearing as a candidate for new classes, but previous class records remain preserved.

What the user does. Student → Manage Student → Parent Access or Status → make change → confirm/save.

F. Teachers — Who Can Teach What and When

Teacher Profile and Teaching Capabilities

VIG cannot assume every teacher can teach every subject or level. Each teacher therefore has explicit teaching capabilities: the subjects they teach and the levels they are qualified or assigned to teach. This becomes a scheduling constraint. The Teacher Profile combines this with availability and exceptions so the administrator can understand both what the teacher can teach and when they can teach it.

Example in practice. Priya teaches Mathematics Levels 5–7, while Meera teaches English Levels 4–6. VIG should not recommend Meera for Aarav's Mathematics class simply because she is free.

What the user does. Teachers → teacher → Teaching Capabilities → add subject and level range → save.

What VIG does in the background. Scheduling filters teacher choices using these capabilities.

Regular Teacher Availability

Regular availability represents a teacher's normal repeating week. It answers 'When is this teacher generally available?' and is used by the scheduling engine whenever it searches for class times.

Example in practice. Priya normally teaches Monday–Friday from 8:30 to 2:30.

What the user does. Teacher → Availability → enable days → set time windows → save.

Temporary Availability Exceptions

Real life does not follow a perfect weekly template. A temporary exception overrides regular availability on a specific date without forcing the administrator to rewrite the teacher's normal week. This can represent leave, an appointment, a special extra-available period or a partial-day change.

Example in practice. Priya is normally available Friday, but on August 7 she is unavailable until noon. Admin adds a one-day exception. Her normal future Fridays remain unchanged.

What the user does. Teacher → Availability → Add Exception → choose date → choose available/unavailable → set all-day or time range → optional reason → save.

What VIG does in the background. On the exception date, VIG uses the exception before the recurring weekly rule and checks existing classes for impact.

G. Scheduling — Turning People and Curriculum into Classes

Schedule Calendar

The Schedule is the operational timetable created from all the setup data. The week view gives the administrator the overall pattern, while the day view makes a single day easier to inspect. A class connects a student or group, a subject, a teacher, a time, duration and recurrence. The schedule is therefore where curriculum, teacher capability and both parties' availability finally meet.

Example in practice. Tuesday at 9:00 may contain Aarav — Mathematics — Priya — 60 minutes, while 10:30 contains another student with Meera.

What the user does. Schedule → week/day → navigate date → open an existing class or choose Add/Schedule Class.

Natural-Language Scheduling

Instead of forcing the administrator to manually compare calendars, VIG can accept a plain-language request. The administrator describes the desired class as they would to another person. VIG extracts the student, subject, preferred teacher, frequency, duration and time preference, then searches for valid options. Crucially, VIG shows what it understood before doing anything so an incorrect interpretation can be fixed.

Example in practice. Admin types, 'Schedule Aarav for Mathematics with Priya twice a week, preferably in the morning, one hour each.' VIG converts that sentence into structured constraints.

What the user does. Schedule → Schedule Class → type/speak request → VIG displays interpretation → admin edits if necessary → Find Options.

What VIG does in the background. VIG combines the interpreted request with teacher capabilities, student availability, teacher availability, temporary exceptions and existing classes.

Suggested Slots and Confirmation

VIG should not simply choose a time and hope it works. It returns one or more valid recurring patterns and can label the strongest option as Best Match. The administrator selects an option, reviews the exact recurrence and sees a preview before saving. This keeps the AI useful without taking control away from the school.

Example in practice. VIG suggests Monday/Wednesday at 10:00 as Best Match and Tuesday/Thursday at 11:00 as another valid option. Admin chooses Monday/Wednesday.

What the user does. Find Options → compare suggestions → select → Review → preview timetable → Confirm & Save → success.

Changing the Schedule by Voice or Text

Schedule changes are where natural language becomes especially valuable because one real-world problem can affect several classes. The administrator can say what changed rather than opening each class individually. VIG identifies the affected classes and proposes a set of moves. Those moves are never applied invisibly: the administrator sees old and new times and confirms the whole proposal.

Example in practice. Admin says, 'Priya is unavailable Friday morning. Move all her affected classes to the next available afternoon slots this week.' VIG finds the impacted classes and proposes alternatives.

What the user does. Schedule → Change Schedule → speak/type request → VIG interprets → Proposed Changes → inspect each move → Confirm & Apply or edit/cancel.

What VIG does in the background. VIG validates proposed changes against current constraints before presenting them.

H. Development — Recording Growth Beyond Academics

Development Areas and Stages

VIG treats development as a longitudinal record of observed growth rather than a numerical score. Areas can sit under broader categories such as Personality, Emotional and Physical development. Each area can have a qualitative stage such as Emerging, Developing or Consistent, but the important part is the evidence behind that stage.

Example in practice. A child's Confidence area may currently be Developing because teachers have recorded several situations where the child began volunteering answers and presenting work independently.

What the user does. Development → student → category → area → view current stage and evidence.

Development Observations

An observation is a dated piece of evidence describing something meaningful that was actually seen. It can be written manually or originate from a teacher's class record, and it can include supporting media. After adding evidence, an authorized user may update the current stage if the new evidence justifies it.

Example in practice. Teacher notes, 'Aarav volunteered to explain his solution to the group without prompting.' That becomes evidence under Confidence.

What the user does. Area → Add Observation → write observation → attach media if useful → date/observer/class context → optionally update stage → save.

What VIG does in the background. VIG appends evidence to the timeline rather than replacing old observations.

I. Moments

Moments

Moments are photos or videos with educational context, not a generic school photo feed. A moment should answer what happened, when it happened, which students were involved and what class or subject it came from. Media added during a teacher's class record can become a Moment so it does not need to be uploaded twice.

Example in practice. During a science experiment, the teacher takes a photo of three students testing their model. The moment is tagged to those students, Science and that day's class, with a short caption.

What the user does. Moments → Add Moment → attach media → select students → add title/caption → verify date/subject/class → save.

Media consent rule: VIG does not require a separate media-consent form. Signing the Parent Agreement constitutes acceptance of the Media, Photography & Social Media Policy.

PART II — TEACHER PORTAL: HOW IT WORKS

The Teacher Portal is deliberately much narrower than the Admin Portal. A teacher should not spend their day managing the school's database. They should see the classes they need to teach, understand the students in those classes and be able to document what happened with as little friction as possible.

A. The Teacher's Day

Teacher Home / Today

The teacher's Home screen is essentially a work queue for the day. It lists assigned classes in time order and shows whether each class has not happened yet, needs a class record, or already has a completed record. This makes the next action obvious without requiring the teacher to search through a general calendar.

Example in practice. At 11:15, Priya sees that her 9:00 class is marked Class Record Needed, her 11:30 class is Upcoming and yesterday's class is Complete.

What the user does. Login → Today → open the relevant class → teach/record → return to Today.

Open Class and Previous Context

Before a class begins, the teacher can open it to confirm who is attending, what subject/level the class is for and what happened last time. The previous-class context is especially useful for continuity: the teacher can remind themselves what was covered without digging through the student's entire history.

Example in practice. Before Aarav's Mathematics class, Priya sees that the previous session covered adding unlike fractions and can open the last record if she needs more detail.

What the user does. Today → Open Class → inspect students and previous class → Start Class.

B. The Core Class Record Flow

Attendance

Attendance is the first step because VIG needs to know who was actually present before it can associate observations with students. Each student can be marked Present, Absent or Late. This information becomes part of the class record and also prevents the AI workflow from assuming an absent child participated.

Example in practice. Three children are scheduled, but Maya is absent. Priya marks Maya Absent before continuing.

What the user does. Start Class → Attendance → mark every child → optional note → Continue.

What VIG does in the background. VIG carries attendance into the record and should not generate unsupported observations for absent students.

Voice Recording

The voice recording is the central time-saving feature for teachers. Instead of filling separate forms for the class, every student, learning progress and development, the teacher speaks naturally for a minute or two after the class. They can describe what was taught, how the group responded and individual observations in one recording. The teacher does not need to speak in database language.

Example in practice. Priya says, 'Today we worked on unlike fractions. Aarav understood the common denominator quickly and solved the first four independently. Riya understood the concept but needed prompting on the word problem. Aarav also volunteered to explain his method to the group.'

What the user does. Attendance → Record Class → tap record → speak naturally → pause if necessary → Finish Recording.

AI Processing

After the recording ends, VIG turns the speech into structured information. It transcribes the recording, identifies which parts refer to the overall class and which refer to individual students, and drafts possible learning or development updates. This processing exists to reduce teacher typing, not to make autonomous judgments. Nothing generated here should be considered final.

Example in practice. From Priya's recording, VIG drafts an overall class note, an Aarav observation, a Riya observation, a possible Fractions learning update and a possible Confidence development observation.

What the user does. Finish Recording → processing screen → AI Results opens when ready.

What VIG does in the background. VIG uses the known class roster and curriculum context to structure the draft, while preserving teacher review as the approval layer.

Reviewing the AI Draft

The review screen is where the teacher corrects the machine before the information becomes part of a child's record. The teacher first reads the overall class note, then the individual student observations. Every generated statement should be editable or removable. This is essential because a fluent AI summary can still misunderstand what the teacher meant.

Example in practice. If VIG says Riya 'mastered' word problems but Priya actually said she needed prompting, Priya edits the draft before continuing.

What the user does. AI Results → review Overall Class Note → edit if needed → review every Student Observation → edit/remove inaccurate text → Next.

Learning Updates

VIG can use the reviewed class note to suggest changes to curriculum skill statuses, but the teacher decides whether those changes are justified. A proposed update should show which student, which skill and what status change is being suggested. Teachers can accept it, edit it, remove it or manually add another update.

Example in practice. VIG suggests changing Aarav's 'Add unlike fractions' skill from Learning to Mastered. Priya agrees and approves it. It suggests Mastered for Riya too, but Priya changes hers to Needs Support.

What the user does. Updates → Learning → inspect each proposal → accept/edit/remove → optionally Add Learning Update.

Development Updates

The same principle applies to non-academic development. If the teacher describes a meaningful behavior, VIG can suggest turning it into development evidence. The teacher decides whether the observation is significant and which area it belongs to. A single class does not have to generate development data.

Example in practice. Because Aarav voluntarily explained his solution to the group, VIG proposes a Confidence observation. Priya reviews and accepts it.

What the user does. Updates → Development → inspect proposed observation → edit/accept/remove → optionally Add Development Update.

Adding Photos and Videos

Media can be attached while the teacher is already completing the class record. VIG then knows the class, date and subject automatically; the teacher only needs to identify the students and add useful context. Approved media can become a Moment linked to the relevant children.

Example in practice. Priya attaches a photo of the fraction activity, tags Aarav and Riya and adds 'Explaining different solution methods.'

What the user does. Updates → Add Media → select/attach file → tag students → add context → continue.

Final Review and Save

The Final Review is the teacher's last checkpoint. Instead of saving each AI suggestion independently, VIG shows the complete record in one readable screen: attendance, overall note, student observations, approved learning changes, development evidence and media. The teacher can jump back to edit any section. Only Save Class Record commits the information.

Example in practice. Priya reviews the complete record, notices Riya's attendance is correct, confirms Aarav's learning change and then saves.

What the user does. Final Review → inspect every section → Edit if necessary → Save Class Record → success.

What VIG does in the background. On save, VIG writes the class record and only the teacher-approved updates into the appropriate student histories.

C. What Happens After the Teacher Saves

Automatic Record Distribution

The teacher should not have to re-enter the same information in multiple parts of VIG. Saving the class record becomes the trigger that distributes approved information. The class note remains in the class history, accepted learning changes update the Learning Map, accepted development observations append to Development, and approved media becomes available in Moments. Eligible information can later appear in the parent's weekly update.

Example in practice. One saved class record can update Aarav's Fractions skill, append a Confidence observation and add a Science/Math moment without Priya visiting three separate modules.

What the user does. Teacher taps Save once → VIG confirms what was updated → teacher returns to classes or opens the saved record.

Teacher Student View

Teachers can also open an assigned student's profile when they need more context outside a class. They can inspect current learning progress, development history and moments according to their permissions. This helps a teacher understand the child longitudinally rather than treating each class as isolated.

Example in practice. Before planning next week's lesson, Priya opens Aarav's Learning Map to see which Level 6 skills still need support.

What the user does. Students → student → Learning / Development / Moments → inspect or add permitted evidence.

PART III — PARENT PORTAL: HOW IT WORKS

The Parent Portal is not a simplified Admin Portal. It has a different purpose. Parents do not need scheduling controls, teacher availability or AI drafts. They need to understand what their child is doing, how they are progressing, how they are developing and what meaningful experiences happened during the week.

A. Parent Home

Parent Home

Parent Home is a concise summary of the child rather than a wall of school data. It identifies the child clearly, promotes the latest weekly update, shows a small Learning Now snapshot, a Development Snapshot and a recent Moment. Each summary links into a deeper section if the parent wants detail.

Example in practice. Aarav's mother opens VIG on Friday and sees 'Your weekly update is ready,' Mathematics — Fractions — Learning, Confidence — Developing, and a photo from a recent activity.

What the user does. Login → Home → read snapshot → open Weekly Update, Learning, Development or Moment as desired.

Weekly Update Notification

The weekly notification is the main mechanism for bringing parents back into VIG. Rather than expecting them to check the app every day, VIG tells them when a consolidated update is ready. Tapping the notification should take them directly to the relevant child/week.

Example in practice. Friday evening: 'Aarav's weekly update is ready.' His mother taps it and lands on that week's report.

What the user does. Receive notification → tap → authenticate if necessary → Weekly Update.

B. The Weekly Update

Week at a Glance

The weekly update combines approved information from the week's saved class records into a parent-friendly story. It is not a raw dump of every teacher note. The top gives a short overview of what the child worked on and what stood out, followed by sections for learning, development, moments and an optional teacher note.

Example in practice. Instead of showing six class records, Aarav's report says he worked on fractions and reading comprehension, became more independent with common denominators and showed increased confidence explaining his work.

What the user does. Home/notification → Weekly Update → read Week at a Glance → scroll through highlights.

Learning Highlights

Learning Highlights select the academically meaningful changes from the week. Parents see understandable statements and can open the full Learning section if they want to inspect the curriculum structure. The weekly report should not force them to interpret every internal skill update.

Example in practice. The report says, 'Aarav mastered adding unlike fractions and is now working on fraction word problems.'

What the user does. Weekly Update → Learning Highlights → View All Learning for detailed subject/skill progress.

Development Highlights

Development Highlights show meaningful observed growth that teachers approved during the week. The goal is to provide evidence and context, not label the child with a score. Parents can then open the Development area to see the longer evidence history.

Example in practice. The report includes, 'Aarav volunteered to explain his solution to the group, showing growing confidence in presenting his thinking.'

What the user does. Weekly Update → Development Highlights → View All Development.

Moments and Teacher Note

Photos and videos make the weekly report tangible, while a teacher note can add human context that structured fields cannot capture. Moments retain their subject/date/class context so parents know what they are looking at rather than seeing an unexplained photo.

Example in practice. The weekly report contains a photo of Aarav explaining his fractions method and a short teacher note about his participation that week.

What the user does. Weekly Update → open a Moment for detail → read Teacher Note → return to report.

PDF Weekly Report

Where enabled, the desktop Parent Portal can generate a PDF version of the weekly update. This is useful for families who want to keep an offline record or share the report within the family. The PDF should reflect the same approved information shown in VIG rather than creating a separate reporting workflow.

Example in practice. Parent opens Friday's update and chooses Download PDF to save that week's report.

What the user does. Weekly Update → Download PDF → VIG generates the report.

C. Parent Learning

Learning Progress

The Learning section gives parents a deeper view of academic progress. They can choose a subject, see the child's current level, then inspect topics and skills with statuses such as Mastered, Learning, Needs Support and To Learn. Unlike the Admin or Teacher view, this is read-only and written in a way that helps the parent understand progress rather than manage curriculum.

Example in practice. Aarav's mother opens Mathematics Level 6 and sees Fractions mostly mastered, Ratio & Proportion currently learning and one skill marked Needs Support.

What the user does. Learning → choose subject → view current level → open topic → inspect skill statuses.

Learning History and Level Changes

When the school moves a child to a new level, the Parent Portal shows the new active level but does not erase the old one. This lets parents understand progression over time and prevents the misleading impression that the child started from scratch.

Example in practice. Aarav moves from Mathematics Level 6 to Level 7. His mother sees Level 7 as current while his Level 6 history remains accessible.

What the user does. Learning → current level/history → inspect previous progression when needed.

D. Parent Development

Development Progress

The Development section organizes the child's growth into areas under categories such as Personality, Emotional and Physical. Each area can show a current qualitative stage, but the supporting observations are what explain that stage. Parents therefore see both the current picture and the real teacher evidence behind it.

Example in practice. Confidence is marked Developing, and beneath it are dated observations showing Aarav volunteering answers and presenting work independently.

What the user does. Development → category → area → read current stage → inspect latest observation or View All Evidence.

Evidence History

Development changes gradually, so VIG keeps observations chronologically. A parent can see how an area evolved over months rather than receiving a single unexplained label. Old observations remain part of the record even if the current stage changes.

Example in practice. Three months of Confidence observations show Aarav moving from rarely speaking in a group to regularly explaining his thinking.

What the user does. Area → View All Evidence → chronological timeline.

E. Parent Moments

Moments Gallery and Detail

The Moments section gives parents a visual history of the child's experiences at the Gurukulam. Parents can browse photos and videos, filter them and open an item to see its title, date, subject/class, teacher, tagged students and caption. Because the media often comes directly from class records, it remains connected to the learning experience that produced it.

Example in practice. A parent opens a science-project photo and sees that it came from Tuesday's Science class, which students participated and the teacher's caption explaining the activity.

What the user does. Moments → browse/filter → select media → view full context.

The Parent Portal never exposes an AI-generated draft. A piece of information becomes eligible for parent viewing only after the relevant school workflow has saved/approved it.

PART IV — COMPLETE STORIES: HOW EVERYTHING CONNECTS

Story 1 — From Nothing to a Running School

The school receives a new VIG account. Admin first creates Mathematics, English and Science, then builds the levels, topics and skills inside them. Next, Admin adds Priya and Meera as teachers, specifies which subjects and levels each can teach and enters their normal availability. Admin then adds Aarav as a student, assigns his current level in each subject, records his weekly availability and connects his parent's account. Only now does scheduling make sense. Admin asks VIG to schedule Aarav's Mathematics classes with Priya twice a week. VIG checks both people's availability, Priya's capability, existing classes and exceptions, suggests valid options and lets Admin confirm one. Priya now sees those classes automatically in her Teacher Portal, and Aarav's parent account is ready to receive approved information after teaching begins.

Story 2 — One Class Moving Through the Entire Product

At 10:00 on Monday, Priya opens Aarav's scheduled Mathematics class. She checks the previous class, starts today's session and marks attendance. After teaching, she records a short voice note explaining that the class covered unlike fractions, that Aarav solved several examples independently and that he volunteered to explain one solution to the group. VIG transcribes the recording and drafts an overall class note, an Aarav-specific observation, a possible learning update for the fractions skill and a possible Confidence observation. Priya reviews everything. She corrects any wording, approves the learning update and accepts the Confidence observation. She also adds a photo from the activity. On Final Review she sees the complete record and taps Save. That single save stores the class record, updates Aarav's Learning Map, appends evidence to Confidence and creates a contextualized Moment. Nothing had to be entered four times.

Story 3 — What the Parent Eventually Sees

Aarav's parent does not see Priya's raw recording, the AI processing screen or the unapproved draft. Once the teacher has saved the record, the approved pieces become part of Aarav's history. During the week, other teachers complete their own class records in the same way. At the end of the reporting period, VIG can consolidate those approved records into Aarav's Weekly Update. His parent receives a notification, opens the report and sees a short week-at-a-glance summary, learning highlights, development highlights, recent moments and any teacher note. If she wants detail, she can open Mathematics to see the exact curriculum progress, Confidence to see the evidence timeline, or Moments to see the class photo.

Story 4 — A Teacher Becomes Unavailable

Suppose Priya is normally available Friday morning but becomes unavailable for one specific Friday. An availability exception is added rather than changing her normal weekly hours. VIG compares that exception with the timetable and discovers that three existing classes are affected. Admin Home shows one grouped Needs Attention issue: Priya is unavailable and three classes need resolution. The administrator opens the issue and can either reschedule manually or say something like, 'Move Priya's Friday morning classes to valid afternoon slots this week.' VIG checks student availability, teacher availability and other bookings, then proposes changes. Admin reviews every old and new time and confirms. Only then are the classes moved, and Priya's Teacher Portal reflects the new timetable.

Story 5 — A Student Advances a Level

Over time, teacher-approved class records change Aarav's Mathematics skills from To Learn to Learning, Needs Support or Mastered. When the school believes he is ready for Level 7, an authorized user opens his Level 6 progress and starts the level-completion flow. VIG summarizes what is mastered and what remains unfinished. The school decides whether any unfinished skill should continue into the next stage, then confirms the move. VIG changes Aarav's active Mathematics level to Level 7 but retains Level 6 as history. Future teachers see the new level in class context, while his parent sees Level 7 as current and can still understand the progress that led there.

PART V — RULES THAT MAKE THE PRODUCT COHERENT

- Information should be entered once and reused. A saved teacher class record should feed learning, development, moments and parent reporting where appropriate.
- AI drafts; humans approve. VIG may structure speech or propose schedule changes, but it should not silently publish consequential information.
- Parents see approved outcomes, not operational machinery or AI drafts.
- Availability is a constraint; the timetable is a booking. They are related but not the same thing.
- Curriculum is Subject → Level → Topic → Skill. Student progress is attached to those skills.
- Development is evidence over time, not a numerical score.
- Historical records are preserved when current states change.
- Empty data, loading, errors and offline conditions must look different so users understand what is happening.
- Admin, Teacher and Parent can refer to the same underlying child/class, but each portal presents only what that role needs.
- Signing the Parent Agreement constitutes acceptance of the Media, Photography & Social Media Policy; no separate media-consent form is required.

The entire VIG system in one paragraph

Admin creates the educational and operational structure of the Gurukulam and uses that structure to produce a valid timetable. Teachers receive only the classes and student context relevant to them. After each class, the teacher marks attendance and speaks naturally about what happened. VIG converts that speech into a structured draft, the teacher reviews it and explicitly saves the final record. That one approved record becomes part of the child's academic history, development evidence and moments as applicable. Across the week, these records accumulate into a meaningful longitudinal student profile. Parents receive a separate, simplified experience that turns those approved records into understandable learning progress, development stories, visual moments and a consolidated weekly update. Admin remains responsible for the operation of the school, Teacher remains responsible for the truth of classroom records, and Parent receives the resulting story of the child.
